

Scenario Overview

I am focusing on Girls Not Brides: The Global Partnership to End Child Marriage, a UK registered charity with a global partnership of 1,400 organisations in 100 countries to end child marriage. It has three strands of activity: Movement-building, Influencing, and Learning, linking partners to funding, expertise, and learning resources and acting as a collective to advocate for change.

Real-World Challenge

UNICEF reports that 12 million (1 in 5) girls marry in childhood every year, often facing domestic violence, education loss, early pregnancy, poor mental health and poor gender equality. This global issue is prevalent but varies according to legislation and region. Child marriage data has expanded with national surveys like UNICEF's Multiple Indicator Cluster Surveys (MICS). Data collection and reporting matters for shaping laws, global campaigns and specific projects and my database will bring together diverse data to offer a more complete view.

United Nations Sustainable Development Goal Alignment

Within Gender Equality, SDG Target 5.3 is to "Eliminate all harmful practices, such as child, early and forced marriage...". Girls Not Brides is fully aligned to this SDG Target, working with global partner organisations to end child marriage. Its website highlights the link between the SDG and their work. Without change, a further 150 million girls will be married by 2030.

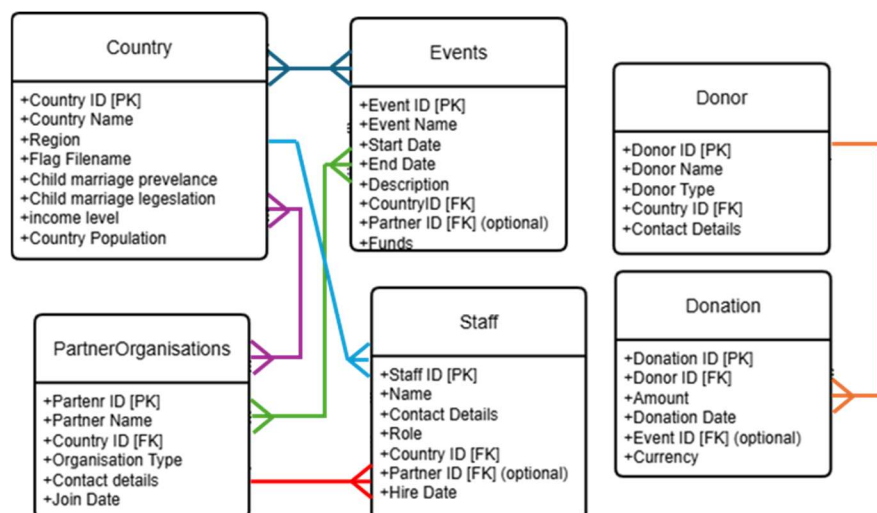

Proposed System and Key Users

My CRUD-based system will provide data on child marriage and legislation, and information on GNB partners, donors, events and staff. The primary users are GNB (Operations and Finance Directors) and Partner Organisations who will use it to maximise the impact of interventions. The following tables will be created, updated and reviewed by GNB: Country Information: Child Marriage Statistics and Legislation per country, used by GNB (Operations Director), Partner Organisations and available to the public. Partner Organisations: Details of partners working with GNB, used by GNB (Operations Director), Partner Organisations and available to the public. Donors: Details of people/groups that fund work on child marriage, used by GNB (Finance Director) and Partner Organisations. Donations: Details of c. £5m annual donations made to GNB, used by GNB (Finance Director) and the UK Charities Commission. Not for the public. Events: Details of c. £5m spend on fundraising, global campaigns, initiatives, or projects, used by GNB (Operations Director) and Partner Organisations. Not for the public. Staff Information: Details of the 26 employees and 6 trustees of GNB, used by GNB (Finance Director) only.

Data Sources and Evidence Base

The entity Country will use the UNICEF data warehouse and the Girls Not Brides interactive atlas and charts as its data source for statistics on child marriage and legislation per country. Fields for this entity will include country name, region, child marriage prevalence and legislation attributes. For this entity a primary key such as country id would make sense. The entities Partner Organisations, Events and Donors will use data from the Girls Not Brides website and Annual Reports to the Charity Commission for England and Wales. Implementing Attributes such as the partner organisations country and join date, the different events start date and description, and the donors name and country. This should be implemented using a combination of real world data from the sources above and sample data. A major constraint in my system will be the entities Donations and Staff Information because this data is not publicly available but will be needed to support financial accountability and governance. I will use sample rather than real data for these two entities, structured using the fields in UK Charity Commission reporting. Surrogate keys should be used for all the entities above in order to maintain referential integrity and create uniquely identifiable records.

Initial Data Model (ERD), Including Attributes under the Entities

Relationships (and link tables)

tblCountryEvents

Many **Events** are happening in many **Countries**.

(multi- country events)

tblPartnerEvents

Many **Events** which are run by many **Partners**.

(multi-partner events)

tblCountryPartners

Many **Partners** in many **Countries**.

(multi-country partners)

Key CRUD Functionality

These are the core Create, Read, Update and Delete operations that the system must support:

Country – Create, Read, Delete, Update: (Child Marriage, Child Marriage Laws, income level).

Partner Organisations – Create, Read, Delete, Update: (Partner Name, Contact Details).

Donor – Create, Read, Delete, Update: (Donor Name, Contact Details).

Donations – Create, Red, Delete, Update: (Donation Amount, Donor Name).

Events – Create, Read, Delete, Update: (Description, Start Date, End Date, Expenditure, Income).

Staff – Create, Delete, Update: (Name, Contact Details, Role).

My initial reporting ideas will address the following questions:

- **How many partners operate in a specific country or region?** Using the country id foreign key in Partners then connected to the region/country.
- **Which countries show high child marriage prevalence but low partner coverage?** Using the country IDs in the Country and Partner tables. The Number of partner records
- **Has child marriage changed over time where Girls Not Brides and partners are most active?** Using the country table (country and child marriage statistics), partner organisations (location), and Events (expenditure).
- **Is funding allocation aligned with countries showing the highest child marriage prevalence?** Using the Country ID in the events table to monitor funding allocation.

Data Integrity and Security Considerations (Examples from the Tables)

Table	Field	Data Type	Description	Constraints
Country	Country ID	INT	Unique identifier per country	PK, Auto- Increment, UNIQUE
	Marriage prevalence	INT	Number of Marriages to girls under 18	(either no data/null or number). CHECK (marriage prevalence < Country population)
Partner Org	Country ID [FK]	INT	Identifier linking the partner to a country	NOT NULL, FK (country)
	Join Date	DATE	When organisation joined GNB	NOT NULL , CHECK for future date
Events	Partner ID	INT	Identifier linking Event/Partner	NOT NULL, FK (partner organisation)
	Funds	INT	Fund (either negative if used or positive if raised)	NOT NULL
Staff	Role	VARCHAR(20)	Role of Staff member within the organisation	NOT NULL (could be enum) CHECK IN(“”,...)
	Country ID	INT	Identifier linking the staff member to a country	NOT NULL, FK (country)
